

## **Grass, Forb & Shrub Response on Four Prescribed Burns in NE California**

Joseph A. Wagner; BLM; Contact Author Email: [jawagner@or.blm.gov](mailto:jawagner@or.blm.gov)

This poster will present ten years of monitoring data on four prescribed fires in NE California. These burns were conducted between 1985 and 1993. The vegetation type burned was Mountain Big Sagebrush and Western Juniper. The herbaceous (grass & forb) production values were determined by 9.6 sq. ft. clipping plots in which grass and forbs were separated. Shrub cover and density were determined by line intercept and belt transects. Data for grass, forb and shrubs will be compared against NRCS Range Sites descriptions. The sample years were 5 years apart (1996, 2001 & 2006).
